YERIK: SOFTWARE

INTERESTING/INNOVATIVE FEATURE:

LINE REMEMBRANCE FEATURE

Constantly updates a status to immediately return to inside of the field if the fully passed the lines.

```
//based off current status (in or out or on line), move in different direction.  
if (current_status == 0 || current_status == 1 || current_status == 2) {  
    facing_before = line_dir;  
    facing_after = line_dir;  
    if (current_status == 0) {  
        move_dir = e;  
    } else if (current_status == 1) {  
        move_dir = line_dir + 180;  
    } else if (current_status == 2) {  
        move_dir = line_dir;  
    }  
} else {  
    move_dir = facing_before;  
    return move_dir;  
}
```

CHALLENGES ENCOUNTERED:

- Main PCB not ready until last week before states. We had to have a very efficient testing schedule:
 1. IMU
 2. Motor drivers
 3. Light sensors
 4. Software

LESSONS LEARNED:

- Main PCB should be done first
- More time = more testing = better results
